

ABSTRACT

The present invention provides a method and a system for online real-time query about a current status of an optical component. The method includes setting up a database and utilizing the database for recording information about the current status of the optical component, wherein the information includes a manufacturing status of the optical component. The method also includes establishing a connection between the database and a remote terminal through the Internet and utilizing the remote terminal to read the information stored in the database for acquiring the current status of the optical component.
